

Where were you when the power went OUT?

Did your Sump Pump stop and cause your basement to flood?

- ✦ Millions of dollars of meat and produce was lost with no power to fridges and freezers.
- ✦ Lots of people forced to find shelter elsewhere as their home had no power.

IT DOESN'T HAVE TO HAPPEN AGAIN!!

An Automatic natural gas powered emergency back-up generator

- ✦ An emergency power generator monitors your acreage's power supply 24 hours a day, 7 days a week.
- ✦ When there is a power outage, the generator detects the problem and automatically goes to work. You don't need to flip a switch or even be home for the emergency power generator to shift into gear: it is self-activated.
- ✦ The unit is installed in a discreet place outside your home, runs on your existing natural gas line (or propane for backup) and provides years of maintenance free dependability.
- ✦ These automatic standby power systems consist of a generator and a transfer switch: in the event of an interruption in the electrical supply, the automatic transfer switch safely disconnects the utility line and connects the standby power line from the generator.
- ✦ Your power is restored within seconds, whether or not you're home.
- ✦ When primary power is detected again, the transfer switch reverts the power supply back to the primary source, returning the generator to standby mode.
